

## TEKNAI RESINS

Teknai® Resins Technology presents RESINS BOOK, a publication devoted to the expression and application of resins, focusing on the world of architecture and design, both public and private. Resins Book is intended mainly as an easy-to-use guide for professionals, but it can also be used by anyone wishing to learn more about the use of resins. With this book Teknai aims at consolidating an exclusive relationship with those in the business and continue to meet

the needs of both architects and designers. The ideas and information contained in the book are meant to help professionals develop resin floorings and coverings for a wide range of applications in residential, contract and industrial roomsets. The ultimate goal of the company is that of turning resin into a leading element in interior design, manufacturing and laying floorings and coverings made of resin, a top-performing material, using an innovative production process. Resin has got an infinite potential in terms of colour palette and artistic effects, allowing bespoke applications to suit all particular settings. Teknai has also its own team of qualified resin-laying experts attending professional training courses. This corporate policy enables Teknai to guarantee the superior quality of its products: the customer's only concern is that of selecting the requested colour effect and the final look. Teknai's idea of resin is that of an architectural skin for settings and behaviours that determine the shape and perception of

things. Flexible and resistant, it provides top performance and innovative design. Resin projects are first of all great opportunities to tell stories and create relationships, thus bringing new perspectives to light that awaken the senses. Resins have been used in the building industry for over 30 years. The use of resin in interior design has been increasing rapidly in recent years, revolutionizing the finished look and opening up new horizons in the design world. Combined with the latest lighting technologies such as optic fibers and Led technologies, resins provide transparencies and light effects strongly impacting on the environment. Resin floorings and coatings result from the need to customize surfaces anywhere - residential, contract and industrial. The resins market is a rapidly-growing sector since the resin can be applied to any surface and allows for infinite creative solutions to meet structural requirements and varying lifestyles. Teknai® Resins Technology operates all over Italy and also worldwide and has gained

widespread recognition thanks to their superior quality and style. The company has distributors all over the world and develops projects jointly with some of today's leading architects and designers. In the contract business segment resins are often the best choice ever. Hotels, showrooms, bars, wellness centres alongside offices and business centers are made unique by the application of Teknai resins.
